

# Data Processing: 1<sup>st</sup> steps

## Cleaning

- Remove useless features. → Pandas: drop
- Null values. → Pandas: isna, info
  - Correct them if you know for sure the exact value they should have.
  - Drop whole rows if a lot of nuls and no relevant info. → Pandas: dropna, drop
  - Drop whole columns if a lot of nuls and no relevant info. → Pandas: dropna, drop
- Duplicated values. → Pandas: duplicated
  - Are they erroneous? Remove them. → Pandas: drop\_duplicates
  - Are they valid? Decide what to do.
- Outliers. → Pandas: describe
  - Are they erroneous? Remove or correct them.
  - Are they valid? Decide what to do.
- Dropping very highly correlated columns may help some ML algorithms. → Pandas: corr, drop

## Build

- Create new (likely useful) features.
