

Data Understanding

First inspection

- Check dataset's dimensions. → Pandas: `shape`
- Look at the columns and their values. → Pandas: `head`, `tail`, `describe`, `info`
- Check column types. → Pandas: `dtypes`, `info`
- Convert some columns to a specific type. → Pandas: `astype`, `to_datetime`

Automatic profiling

- Library: `fg-data-profiling`

Exploratory Data Analysis (EDA)

- Any interesting insights about the data.
 - Errors: duplicated rows/columns, out-of-range values. → Pandas: `duplicated`, `describe`
 - Null values. → Pandas: `isna`
 - ...
- Column distributions. → Pandas: `hist`, `boxplot`, `bar`; Matplotlib.pyplot: `hist`, `boxplot`, `barplot`
- Correlations between features. → Pandas: `corr`; Seaborn: `heatmap`
- Relations between features (e.g., pair-plot). → Pandas.plotting: `scatter_matrix`; Seaborn: `pairplot`
- Correlations with the target feature. → Pandas: `corr`
